

Q1.

Statement Given a set of N strings. Each string consists of only lowercase alphabets. Sort each string in increasing order of the frequency of characters. If the frequency of two characters is the same, the character coming later in lexicographical order should come first.

Input format:

First line of input will contain the value of N. The next line will contain N space-separated strings.

Output format:

Multiple strings in a single line separated by space.

Sample input:

2
little kettle

Sample output:

ietll lkttee

Test Case 2
Input 1 aabbccdee pqrpqrpqr

Test Case eeddccbbaa rrrqqqppp
Output 1

Test Case 3
Input 2 zyxabc temple torque

Test Case zyxcba tpmlee utrqoe
Output 2

Test Case 5
Input 3 jdsbhchs bxsahybasyg uawjxasknhxcb ysabgchbcdhy sabhcjshdbchdgv

Test Case jdcbsshh xhgyyssbbaa wusnkjhcbxxaa sgdayyhhccb vjgassddccbhhh
Output 3

Test Case 6
Input 4 hjasbxbc aygbx uayikiakaiia iaiaiaiai hnchcbdbchdy sbccdbgcdv

Test Case xsjhocabb yxgba yukkiiiiaaaa aaaaaiiiii ynddbbhhccc vsggddbccc
Output 4

Test Case 5
Input 5 jdsbdasdsahchs bxfsarwqsahybasyg uawjxqgfdasknhxcb
ysabgctretrehbcdhy sabhctreutyuafdjshdbchdgv

Test Case jcbhhaaddsss xwrqhgfyybbssaaa wuqnkjhgfdcbxxssaa
Output 5 sgdayyrrheecbbtt yvrjgfeuutssccbbaahhhddd

Q2.

Statement	You are given an array of prices of size N. Where $\text{prices}[i]$ is the price of a given stock on the i th day. You want to maximise your profit by choosing a single day to buy one stock and choosing a different day in the future to sell that stock. Return the maximum profit you can achieve from this transaction. If you cannot achieve any profit, return 0
Input Format	Two lines of input. The first line contains integer N. Next line contain array elements in space separated format
Output Format	Print the maximum profit as integer.
Constraint	$2 \leq N \leq 30$ $1 \leq \text{prices}[i] \leq 10^3$
Sample Input 1	6 7 1 5 3 6 4
Sample Output 1	5
Explanation	The 2nd day is the best day to buy the stock and the 5th day is best to sell that stock. The highest profit made is 5 ($= 6 - 1$)
Test Case 1	5 7 6 4 3 1
Test Case 2	0 1 2 3 4 5 6 7
Test Case 3	6 1 2 3 4 5 6 7
Test Case 4	7 1 2 3 4 5 6 7
Test Case 5	0 1 2 3 4 5 6 7
Test Case 6	6 1 2 3 4 5 6 7
Test Case 7	5 1 2 3 4 5 6 7
Test Case 8	0 1 2 3 4 5 6 7
Test Case 9	6 1 2 3 4 5 6 7
Test Case 10	5 1 2 3 4 5 6 7
Test Case 11	0 1 2 3 4 5 6 7
Test Case 12	6 1 2 3 4 5 6 7
Test Case 13	5 1 2 3 4 5 6 7
Test Case 14	0 1 2 3 4 5 6 7
Test Case 15	6 1 2 3 4 5 6 7
Test Case 16	5 1 2 3 4 5 6 7
Test Case 17	0 1 2 3 4 5 6 7
Test Case 18	6 1 2 3 4 5 6 7
Test Case 19	5 1 2 3 4 5 6 7
Test Case 20	0 1 2 3 4 5 6 7
Test Case 21	6 1 2 3 4 5 6 7
Test Case 22	5 1 2 3 4 5 6 7
Test Case 23	0 1 2 3 4 5 6 7
Test Case 24	6 1 2 3 4 5 6 7
Test Case 25	5 1 2 3 4 5 6 7
Test Case 26	0 1 2 3 4 5 6 7
Test Case 27	6 1 2 3 4 5 6 7
Test Case 28	5 1 2 3 4 5 6 7
Test Case 29	0 1 2 3 4 5 6 7
Test Case 30	6 1 2 3 4 5 6 7
Test Case 31	5 1 2 3 4 5 6 7
Test Case 32	0 1 2 3 4 5 6 7
Test Case 33	6 1 2 3 4 5 6 7
Test Case 34	5 1 2 3 4 5 6 7
Test Case 35	0 1 2 3 4 5 6 7
Test Case 36	6 1 2 3 4 5 6 7
Test Case 37	5 1 2 3 4 5 6 7
Test Case 38	0 1 2 3 4 5 6 7
Test Case 39	6 1 2 3 4 5 6 7
Test Case 40	5 1 2 3 4 5 6 7
Test Case 41	0 1 2 3 4 5 6 7
Test Case 42	6 1 2 3 4 5 6 7
Test Case 43	5 1 2 3 4 5 6 7
Test Case 44	0 1 2 3 4 5 6 7
Test Case 45	6 1 2 3 4 5 6 7
Test Case 46	5 1 2 3 4 5 6 7
Test Case 47	0 1 2 3 4 5 6 7
Test Case 48	6 1 2 3 4 5 6 7
Test Case 49	5 1 2 3 4 5 6 7
Test Case 50	0 1 2 3 4 5 6 7

Test Case	89
Output 3	
Test Case	5
Input 4	20 100 2 1 5
Test Case	80
Output 4	
Test Case	9
Input 5	50 100 5 10 15 80 2 25 60
Test Case	75
Output 5	

Q3.

Statement	<p>There are n people that are split into some unknown number of groups. Each person is labeled with a unique ID from 0 to $n - 1$.</p> <p>You are given an integer array <code>groupSizes</code>, where <code>groupSizes[i]</code> is the size of the group that person i is in. For example, if <code>groupSizes[1] = 3</code>, then person 1 must be in a group of size 3.</p> <p>Return a list of groups such that each person i is in a group of size <code>groupSizes[i]</code>.</p> <p>Each person should appear in exactly one group, and every person must be in a group. If there are multiple answers, return any of them. It is guaranteed that there will be at least one valid solution for the given input.</p>
Input Format	The input (<code>groupSizes</code>) consists of a sequence of integers separated by spaces in single line .
Output Format	The output consists of a list of lists (or nested arrays).
Constraint	$\text{groupSizes.length} == n$ $1 \leq n \leq 500$ $1 \leq \text{groupSizes}[i] \leq n$
Sample Input 1	<code>groupSizes = [3,3,3,3,3,1,3]</code>
Sample Output 1	<code>[[5],[0,1,2],[3,4,6]]</code>
Explanation	The first group is [5]. The size is 1, and <code>groupSizes[5] = 1</code> . The second group is [0,1,2]. The size is 3, and <code>groupSizes[0] = groupSizes[1] = 3</code> .

groupSizes[2] = 3.
The third group is [3,4,6]. The size is 3, and groupSizes[3] = groupSizes[4] = groupSizes[6] = 3.
Other possible solutions are [[2,1,6],[5],[0,4,3]] and [[5],[0,6,2],[4,3,1]].

Test Case
Input 1 groupSizes = [2,1,3,3,3,2]

Test Case
Output 1 [[1],[0,5],[2,3,4]]

Q4.

Statement Given a binary array nums, return the maximum length of a contiguous subarray with an equal number of 0 and 1. Expected time complexity is O(n).

Input Format First line contains the value of N. The second line contains N space separated integers.

Output Format A single integer.

Constraint

Sample 3
Input 1 0 1 0

Sample 2
Output 1

Explanation [0, 1] or [1, 0] is a longest contiguous subarray with equal number of 0 and 1.

Test Case 7
Input 1 1 0 1 0 1 0 1

Test Case 6
Output 1

Test Case 5
Input 2 0 0 0 0 0

Test Case 0
Output 2

Test Case 10
Input 3 0 0 0 0 0 1 1 1 1 1

Test Case 10
Output 3

Test Case 8
Input 4 1 1 1 0 1 0 1 1

Test Case 4
Output 4

Q5.

Statement	<p>Geek just learned about Fibonacci numbers.</p> <p>The Fibonacci Sequence is the series of numbers: 0, 1, 1, 2, 3, 5, 8, 13, ... where the next number is found by adding up the two numbers before it.</p> <p>He defines a new series called Geeky numbers. Here the next number is the sum of the K preceding numbers.</p> <p>You are given an array of size K, GeekNum[], where the ith element of the array represents the ith Geeky number. Return its Nth term.</p> <p>Note: This problem can be solved in $O(N^2)$ time complexity but the user has to solve this in $O(N)$. The Constraints are less because there can be integer overflow in the terms.</p>
Input Format	Two lines of input. First line contains two space separated integer. Second line contains K space separated integers.
Output Format	Single integer in single line.
Constraint	$1 \leq K < 30$ $1 \leq N \leq 70$ $K \leq N$ $0 < \text{GeekNum}[] < 100$
Sample Input 1	5 3 0 1 2
Sample Output 1	6
Explanation	Terms are 0, 1, 2, 3, 6. So the 5th term is 6
Test Case Input 1	6 1 4
Test Case Output 1	4
